The optimal acceleration/deceleration is set by setting the weight of the chuck plate and workpiece to be used. Setting the appropriate acceleration and deceleration helps to reduce the amplitude and speed up the cycle. In addition, the maximum movable weight is also increased as an option for the EG-800SII, EGW-800SII. The most optimal acceleration/deceleration parameters of the EG-II series are no longer set to 3, but set to 5.

最适加减速

The speed can be switched from high speed to low speed, low speed to high speed freely while the position point is moving. In difficult teaching that require slow operation, such as insertion work supply and extraction after supply, processing is carried out in a minimum reduction cycle, which can reduce the difficulty of teaching. A maximum of 20 points can be set, and points are specified by the debugging system. Only box Settings are available in the standard specification, so please specify the target point according to the specification.
